A computer programmer is an important role who takes the task of developing efficient and quality code for users. They are responsible for producing quality code as output by taking functional specification and project specifications as input. They analyze various ways of coding and take up efficient approach to code which makes the final output to be delivered with quality to customers and thereby gain customer satisfaction. They are also responsible for working with enhancements in the system if any suggested by customers. Computer programmer also take the responsibility of testing sometimes whereby they prepare test plan and test cases and test various cases of the system to check for integrity and validity of system and record it for further reworking if needed. Thus computer programmers test a program by running it across test cases using test plan to ensure the validity and effectiveness of code and check whether the program produces the desired outcome. If error occurs, the programmer records it in test plan and rework is done on code and again testing process is repeated to recheck the program until it produces the correct results. In this scenario the computer programmers not only test and debug only their code but also the code written by other programmers and developers by understanding the total flow of the system or program. Thus the main function of a computer programmer is to develop, test and also maintain programs or code by following the specifications given to them. Sometimes computer programmers also update, rework, modify on enhancement of existing programs or code.

Computer Programmer Resume

John Dave

4720,130, West curve,

NY 228978

Home: 111-111-1111
